# Divert Recommendations - Planner Summary

*5 focus orders, 3 candidate distribution centers*

## What changed

3 of 5 focus orders are recommended for diversion to an alternate distribution center. 2 stay at their default DC. Recommended fill rate across all 5 orders: 80%, versus 34% if every order stayed at default.

| Order | Recommendation | Stock at default DC | Stock at recommended DC | Reason |
| --- | --- | --- | --- | --- |
| ...7940 | 5410 -> 5420 | 0 cases | 107,854 cases | Zero stock at default DC |
| ...0527 | 5410 -> 5420 | 0 cases | 103,980 cases | Zero stock at default DC |
| ...2182 | 5410 -> 5420 | 0 cases | 75,433 cases | Zero stock at default DC |
| ...0251 | stays at 5620 | 2,348 cases | - | Partial stock at default DC; no alternate clears the divert threshold |
| ...4998 | stays at 5420 | 82,700 cases | - | Default DC already covers most of demand |

## Cost trade-off

Diverting adds shipping cost per order (roughly $1,700-$3,000 for the three diverted orders) in exchange for fulfilling demand the default DC has zero stock for. Total shipping cost across all 5 orders: $8,230, versus $912 if every order stayed at default and the three zero-stock orders went unfulfilled.

## Recommendation basis

Every diversion in this set clears the minimum bar for a divert: at least a 5% fill-rate improvement and at least 100 additional cases filled versus staying at default, while respecting shared inventory limits and dock capacity at the recommended DC.
